## ECOREGION Faroe Plateau ecosystem <br> STOCK Saithe in Division Vb

## Advice for 2013

ICES advises on the basis of the MSY approach that effort should be reduced such that fishing mortality in 2013 will be no more than $\mathrm{F}=0.28$, corresponding to an $44 \%$ reduction in the present fishing mortality.

## Stock status

Figure 4.4.4.1 Saithe in Division Vb. Summary of stock assessment (weights in thousand tonnes). Top right: SSB/F for the time-series used in the assessment.

SSB has decreased substantially since 2006 but remains above MSY $\mathrm{B}_{\text {trigger }}$. Recruitment in 2011 was above average. Fishing mortality has decreased since 2009 and is above $\mathrm{F}_{\text {MSY }}$.

## Management plans

A group representing the Ministry of Fisheries, the Faroe industry, the University of the Faroe Islands, and the Faroe Marine Research Institute has developed a management plan based on general maximum sustainable yield (MSY) principles developed by ICES. The plan has not yet been discussed by the political system.

## Biology

Saithe in Division Vb is regarded as one management unit although tagging experiments have demonstrated migrations between the Faroes, Iceland, Norway, west of Scotland, and the North Sea. Nursery areas for saithe are found very close to land (in the littoral zone). These areas are not covered by the existing surveys and therefore recruitment estimates are not available until saithe enter the fishery at age 3 ; this hampers the prediction of biomass and catch.

## Environmental influence on the stock

Preliminary studies suggest a positive relationship between ocean productivity (gyre index) and the biomass of saithe.

## The fisheries

Saithe are mainly caught in a directed trawl fishery (pair and single trawlers), with bycatches of cod and haddock.
Catch distribution Total landings (2011) are 29 kt , of which $91 \%$ was taken by pair trawlers, $4.5 \%$ by single trawlers, and $3.6 \%$ by jiggers.

## Quality considerations

There are no incentives to discard fish under the effort management system. The sampling of the landings has increased since 2009 and is considered to be adequate. Recruitment indices are only available from age 3 and this is a source of uncertainty in recent recruitment estimates and forecast.

## Management plan

A management system based on number of fishing days, closed areas, and other technical measures was introduced in 1996 to ensure sustainable demersal fisheries in Division Vb. This was before ICES introduced precautionary approach (PA) and MSY reference values, and at that time it was believed that the purpose was achieved if the total allowable number of fishing days was set such that on average $33 \%$ of the haddock exploitable stock in numbers would be harvested annually. This translates into an average F of 0.45 , above the $\mathrm{F}_{\mathrm{pa}}$ and $\mathrm{F}_{\mathrm{MSY}}$ of 0.25 . ICES considers this to be inconsistent with the PA and the MSY approaches. Work is ongoing in the Faroes to move away from the $\mathrm{F}_{\text {target }}$ of 0.45 to be consistent with the ICES advice. This management plan includes a stepwise reduction of the fishing mortality to $\mathrm{F}_{\text {MSY }}$ in 2015 and a recovery plan if the SSB declines below the MSY $\mathrm{B}_{\text {trigger. }}$. The MSY $\mathrm{B}_{\text {trigger }}$ has been defined at 55 kt (the former $\mathrm{B}_{\mathrm{pa}}$ ) and $\mathrm{F}_{\text {MSY }}$ at 0.28 . If the SSB declines below the MSY $\mathrm{B}_{\text {trigger }}$, the fishing mortality will be reduced by the relationship $\mathrm{F}_{\mathrm{MSY}} * \mathrm{~B}_{\text {act }} / \mathrm{B}_{\text {triger }}$ until the SSB has increased again above the MSY $\mathrm{B}_{\text {trigger }}$ and is thereafter kept at $\mathrm{F}_{\mathrm{MSY}}$.

## MSY approach

Following the ICES MSY framework implies that fishing mortality in 2013 should be no more than $\mathrm{F}_{\mathrm{MSY}}=0.28$, resulting in a reduction of $44 \%$ in the present fishing mortality.

## Precautionary approach

Following the precautionary approach implies that fishing mortality in 2013 should be no more than $\mathrm{F}_{\mathrm{pa}}=0.28$, resulting in a reduction of $44 \%$ in present fishing mortality.

## Additional considerations

## Management considerations

The number of fishing days for pair trawlers was reduced by $10 \%$ for the fishing year (2010/2011), but a further reduction of effort is required to bring F at or below $\mathrm{F}_{\mathrm{MSY}}$. The present spawning closures should be maintained for pair trawlers and applied for other fleets also.

## Regulations and their effects

The principal fleets fishing for saithe are pair trawlers, single trawlers, and jiggers. The average annual landings from these fleets since the introduction of the present management system are about $78 \%, 17 \%$, and $4 \%$, respectively. The pair trawlers, jiggers, and single trawlers are regulated by total number of allocated fishing days and by area closures.

Limited sampling in the blue whiting fishery in Faroese waters indicates that bycatches of saithe have been minor since the mandatory use of sorting grids was introduced from 15 April 2007 in the areas west and northwest of the Faroe Islands.

## Changes in fishing technology and fishing patterns

The effort management system can lead to improvement of fishing technology and efficiency. Presently, ICES is not able to quantify these changes.

## Uncertainties in the assessment and forecast

The potential for bias in commercial cpue (for example hyper-stability) is a serious concern for shoaling species such as saithe. For this assessment, in addition to the pairtrawler cpue, which is a measure of saithe density in its core area of distribution, the range of the spatial distribution of saithe was considered, using survey information, when constructing an abundance index for saithe. This approach is considered to reduce the bias. The assessment is very uncertain, with large revisions from year to year. Recruitment indices are only available from age 3 and this is a source of uncertainty in recent recruitment estimates and forecast.

## Comparison with last year's assessment and advice

SSB in 2010 and 2011 has been revised downwards by $35 \%$ and $40 \%$, respectively, compared to last year's estimates. F in 2009 and 2010 has been revised upwards by $14 \%$ and $40 \%$, respectively. The basis for the advice is the same as last year.
